

 SPRAYPRINTER

DESIGN GUIDELINES

The size of the printed area is 320x320 pixels.

When uploading, designs will be resized into the right size and it's possible to crop the image, but we strongly recommend you to size your design beforehand.

Display images can be larger and will not be resized, but the largest they are displayed is 470x470 pixels, and to assure that everyone has a better browsing experience, your images should be sized accordingly.

The maximum size of an uploaded image (both display images and layers) is 2MB.

Every color tone should be uploaded as a separate file.

SprayPrinter uses one spraycan at the time. That means all the colors should be separated into different layers and uploaded as different files.

All the layers are in png format.

All the layers should have a transparent background. Anything that isn't transparent will be marked as sprayprintable area.

The color of the layers should be the same as on the design.

Note that the end user can change the final color schema from SprayPrinter's mobile application. We recommend using Montana water based spraypaint Exact tones available at

<http://www.montana colors.com/webapp/spray?id=560>

The file name of your design must include the order.

The order is ascending (from 1 up). e.g. steampunk_helmet_1.png would be the first layer sprayprinted, steampunk_helmet_2.png would be the second.
